## Monitoring and care for patients with meningoencephalitis in the neuro-ICU

Sang-Beom Jeon

Department of Neurology, Asan Medical Center, University of Ulsan College of Medicine, Seoul, Korea

---

The mainstay of managements of patients with meningoencephalitis is early diagnosis and timely therapeutic interventions with antibiotics and immune modulating treatments. Physicians who manage critically ill patients with meningoencephalitis, however, should also try to understand the body as a whole and not be limited to the brain. The comprehensive care is the critical factor that determines patients' survival and neurological outcomes. In this presentation, the author will introduce how neurointensivists manage critically ill patients with meningoencephalitis using various modalities in the neurological intensive care unit.

---

**Key Words:** meningoencephalitis, monitoring, neurocritical care
